

Making Websites - An Introduction to HTML

1 Edit the text on the website.

- Click "home.html" and it will open in an editing tool.
 - This is the website file. Websites come with specific extensions (the part of the file name after the period) which tells the computer what format the file is in so it knows what program to open it with. In this case html (hypertext markup language) will get shown using a web browser (Internet Explorer, Chrome etc.).
- First, change the background color of the website.
 - To do this put a color in between the quotes "" next to bgcolor.
 - bgcolor stands for background color.
 - *Example: bgcolor="yellow"*
 - Choose any color like red or blue or green
- Next change page heading by changing the text in between <h1> and </h1>.
 - h1 stands for heading #1.
 - *Example: <h1>KTU</h1>*
- NOTE: The things inside < and > are called tags. so <h1> is a "heading 1 tag". Tags do not show on websites but tell the web browser what to show. Many tags (but not all) need an opening tags <h1> and a closing tag </h1> so the web browser knows where to start doing the tag (like showing a heading) and when to stop doing the tag.
- Next tell us about your favorite thing in the paragraph area by changing the text in between <p> and </p>.
 - p stands for paragraph.
 - *Example: <p>I am learning how to make a website.</p>*
- Save the file.
 - You can only see the file in a web browser after it is saved.
- On the desktop click the web browser shortcut, this will open your website so you can view it.

2 Add an image. (falling image maybe too much code?)

- Open "home.html"
- Decide where you would like a picture, then add an image tag using the following code:
 - **
- NOTE: image tags do not need ending tags like many of the other tags you see.
- You can change **dog to cat, penguin or snowman** as those are the images we have in the "pics" folder.
- Save the file and click the web browser shortcut to view your website.

3 Style your text

- You can change the way your text shows. Choose some of the text you put in your paragraph (between the paragraph tags) and edit it.
- Open "home.html"
- Some text style choices:
 - Change the color by adding font tags around the words you want to change
 - Example: `This will be red.`
 - Change the size by adding font tags around the words you want to change
 - Example: `This will be big.`
 - you can combine attributes of the font tag like this:
 - Example: `This will be big and red.`
 - Make it **bold** by adding bold tags
 - Example: `This will be bold.`
 - Make it underlined by adding underline tags
 - Example: `<u>This will be underlined.</u>`
 - Make it *italicized* by adding italic tags
 - Example: `<i>This will be italicized.</i>`
- Now that you know the basics of html, personalize this page by adding something unique about yourself like something you are interested in (music, sports, or an accomplishment) that you would like to share.
- Save the file and click the web browser shortcut to view your website.

4 Make some text scroll across the screen.

- Open "home.html"
- We are going to update the script area, this allows you to have text scrolling across your webpage. Put a few words between the quotes "
 - `var fast_marquee_Text= "`; change to `var fast_marquee_Text = 'scrolling text';`
- You can have it go right to left, or left to right, or top to bottom, or bottom to top! Put the direction you want the text to head toward in the quotes " next to `var ltr_marquee_Direction` (right, left, up, down)
 - `var ltr_marquee_Direction = 'right';`
- Save the file and click the web browser shortcut to view your website.

5 Save your website with a new name

- Right click and rename your home.html file `home_firstname_lastname_favoritenumber.html`
- Click "Back Up My Stuff" icon on the desktop
- The following day, your content will be posted on the website:
 - http://letscodeblacksburg.org/KTU2015/home_firstname_lastname_favoritenumber.html

When done, click "Reset" for the next person
