

## Let's Code Blacksburg! Arduino Sensors and Robotics Workshop

v2015-04-28a\_tweaks

URL: [https://github.com/LetsCodeBlacksburg/LCBB\\_arduino-collision-bot](https://github.com/LetsCodeBlacksburg/LCBB_arduino-collision-bot)

### 1. Build your collision avoidance bot:

- one 6x4 piece of cardboard or foam board
- one arduino microcontroller, mounted as shown
- one ultrasonic sensor (“eyes”), DO NOT PLUG IN until step #2
- two continuous rotating servos, mounted as shown
- one battery holder w/on/off switch, mounted as shown
- three bottle caps (for wheels and “rear dragger”), hot glued

**TA SIGN-OFF:** \_\_\_\_\_

WARNING: DO NOT POWER UP or plug in USB until TA has inspected, and sensor configuration code in step#2 has been uploaded to the arduino.

### 2. Upload sensor code “ping\_US-100\_sensor.ino” to Arduino & Test

- Copy code from github account: [https://github.com/LetsCodeBlacksburg/LCBB\\_arduino-collision-bot](https://github.com/LetsCodeBlacksburg/LCBB_arduino-collision-bot)

- Start up Arduino program (after getting “blink”) working
- Paste ping\_US-100\_sensor.ino into arduino
- Compile (will not work yet). Get TA Sign-off:

**TA SIGN-OFF:** \_\_\_\_\_

**TA SIGN-OFF:** \_\_\_\_\_

- After sign-off, connect the ping sensor as shown using pins 10, 11, 12, 13 and GND on the sensor shield
- Test sensor, using the serial console to witness the sensor range

**TA SIGN-OFF:** \_\_\_\_\_

### 3. Connect the two servos to pin headers 5&6 on the sensor shield

- Connect the servos (while unplugged/powered off)
- Copy the “two-servos-test.ino” servo test code from github URL (above)
- Test your servos and get TA sign-off:

**TA SIGN-OFF:** \_\_\_\_\_

**BOT CHALLENGE:** Try to program your bot to move around to form a 2 foot x 2 foot square

**TA SIGN-OFF:** \_\_\_\_\_

### 4. Make Your Bot Smart - Combine Servo Code & Ping Sensor Code

- Combine the ping sensor and servo code to make your bot stop and avoid collisions.

**TA SIGN-OFF:** \_\_\_\_\_
